Beginner Guide — Firebase One-Click Kit

Written **exactly as you see it on screen**, so even first-time computer users can follow along. Hard words are explained **in parentheses**. GB English. 한국어 → [사용 설명서.md](#)

Order of this guide

- 0. Before you start (just one thing)
 - 0-1. When a file won't open (unblock the download)
 - 1. Install
 - 2. Login
 - 3. Prepare your project
 - 4. Publish to the internet (Deploy)
 - 5. Uninstall
 - 6. When an error happens
 - 7. FAQ
-

0. Before you start (just one thing)

Double-click `시작하기.bat` (Start Here) in the folder. In blue text it shows **your PC status** and **“what to do now”** in one line. Just follow that.

A black (or blue) window may appear — that's normal.

How to choose a menu: move with the **up/down arrows (↑ ↓)** and **press Enter**, or press a **number key**. The green **“지금 이것! ←” (do this now)** is your next step. The red **(주의 / caution)** marks the item to be careful with (Uninstall).

0-1. When a file won't open or “protected” warning appears (unblock the download)

Windows may **lock** files downloaded from the internet for safety. Just unblock them.

- **Way 1 (easiest):** before extracting, right-click the received zip → **Properties** → **check 'Unblock' at the bottom** → **OK**, then extract.
- **Way 2:** right-click 시작하기.bat → **Properties** → **check 'Unblock'** → **OK**, then double-click.
- If a blue **"Windows protected your PC"** window appears → **More info** → **Run anyway**.

Once 시작하기.bat runs, the rest of the files in the folder are **unblocked automatically**. (So usually you only deal with this once.)

1. Install (just once)

1. 시작하기.bat → choose **[1] Install** (pick with arrows + Enter, or press number **1**).
2. (The **admin permission window usually does not appear** now. It may appear once only if Node.js is auto-installed → then press **[Yes]**.)
3. A black window runs in English. **Don't close it; wait** (1–3 minutes).
4. When you see ALL DONE! INSTALL WAS A SUCCESS! , it succeeded.

If it says Node.js (the engine) is missing? → It asks "Install automatically? (Y/N)". Press **Y** and it installs for you. → When auto-install finishes, close the window and run 시작하기.bat **once more**.

2. First use — Login (connect your Google account)

1. 시작하기.bat → **[2] Use**
2. In the menu, choose **1) Login to Firebase**
3. A web browser opens by itself → **sign in with your Google account**
4. When you see "success", close the browser and return to the black window.

You only log in once. It's remembered afterward.

3. Prepare your project (needed before deploy)

Order matters: **Login** → **Create project** → **Deploy**

1. Menu **9) Make a new Firebase project here**
 2. When English questions appear, pick with **arrow keys (↑ ↓)** and **spacebar**, then **Enter**
 3. Use menu **10** to see your project list, and **11** to pick the project to use
-

4. Publish to the internet (Deploy) — caution!

Deploy = making your app **public on the internet for everyone to see**.

1. Menu **15) Deploy everything**
 2. For safety, you must type `YES` (**uppercase**) to proceed.
 3. If there's no project config (`firebase.json`), the kit **blocks it** and tells you "do menu 9 first".
-

5. Uninstall (remove)

1. `시작하기.bat` → **[3] Uninstall** (red (**caution**) mark)
2. Type `YES` → it asks whether to back up settings (Y/N).
3. It is cleanly removed.

Rest assured: even after removal, - your **code files** stay, - **Node.js** stays, - your **data on Google's servers** stays.

6. When an error happens (don't panic)

If you see this	Do this
File won't open / " Windows protected your PC " / blocked	See 0-1. unblock the download above (right-click → Properties → Unblock)
<code>firebase ... not found</code> (installed but not found)	Close all windows and run <code>시작하기.bat</code> in a fresh window
<code>Can not reach the internet</code>	Check Wi-Fi/internet and retry
<code>Install did not work</code>	Open <code>firebase_install.log</code> in the folder and read the last line (antivirus / corporate network blocking is common)

If you see this	Do this
Typed a wrong menu number	It just returns to the menu. No worries

7. FAQ

Q. Do I need to memorize commands? A. No. Just press numbers. (Advanced users can type their own command in RUN menu 25.)

Q. Does it cost money? A. This kit is free. But heavy Firebase usage may incur Google charges — check the Google console. (This kit is unrelated to fees.)

Q. What if I press something wrong? A. Risky actions (deploy, remove) always **ask once more**. You can just close the window.

For more reference (file locations, command table, license), see [README.en.md](#).
