

Firestore Kit EN

Firestore One-Click Kit (Firestore CLI One-Click Kit)

Install, use, and remove Google's **Firestore CLI (firebase-tools)** with a **few clicks** — built for **absolute beginners**. You don't need to know a single command. A Korean-first guide tells you **"the one number to press now."**

1. What is this?

- **Firestore** = Google's **toolkit for building apps** — host a website on the internet, store data, add sign-in, and more.
- **firebase-tools** = the **program (CLI)** that controls Firestore from your PC.
- **This kit** = a Korean-first helper that lets **beginners install, use, and remove** firebase-tools with **clicks only**.

One-line summary: **Double-click** 시작하기.bat **(Start Here)** → **press the number the screen tells you.** That's it.

2. ⚡ Quick Start (3 steps)

Step	What	How
1	Open the kit	Double-click 시작하기.bat (Start Here) in the folder
2	Install	Choose [1] Install (arrow keys or number 1)
3	Log in & use	[2] Use → menu 1) Login → then any task

The top of the screen always points to your next step with “**지금 이것! ←**” (**do this now**). Just follow it.

3. Prerequisites / Required Programs

Item	Required?	Notes
Windows 10 / 11	✓ Required	This kit is for Windows only.
Internet connection	✓ Required	Needed for install, login, and deploy.
Node.js (includes npm)	✓ Required	The engine firebase-tools runs on. You don't need it beforehand — the installer offers to install it automatically.
Google account	Required to use	Needed for login / projects / deploy. (Not needed just to install.)

When you open 시작하기.bat , the top **[Your PC status]** panel automatically shows whether Node.js, Firebase, and login are ready.

4. How to Download

1. On the GitHub kit page, click the green `< > Code` button → `Download ZIP` (or a zip from Releases).
2. **Right-click the zip → Extract All.**
3. When you see 시작하기.bat inside the extracted folder, you're ready.

⚠ **If a downloaded file is blocked (important):** Windows may lock files downloaded from the internet for safety. - **Easiest: before** extracting, right-click the zip → **Properties** → **check 'Unblock' at the bottom** → **OK**, then extract. - If a blue **"Windows protected your PC"** window appears → **More info** → **Run anyway**. - Once 시작하기.bat runs once, **the rest of the files in the folder are unblocked automatically.**

5. How to Install

1. Double-click 시작하기.bat .
2. Choose **[1] Install** (move with ↑ ↓ arrows and press **Enter**, or press number **1**).
3. A black install window runs in English. **Do not close it; wait 1–3 minutes.**
4. When you see ALL DONE! INSTALL WAS A SUCCESS! , install **succeeded**.

If it says Node.js (the engine) is missing? → It asks "Install Node.js automatically? (Y/N)". Type **Y** and it installs for you. → Only then a Windows permission window may appear once (for Node) → **[Yes]**. It's safe. → When auto-install finishes, close the window and run 시작하기.bat **once more**.

💡 Install needs **no administrator rights**, because firebase-tools installs into **your own user folder**. (That's why no Yes/No admin popup appears.)

6. How to Run & Use

After install, go to 시작하기.bat → **[2] Use**, which opens the **Use menu (RUN)** with 25 actions.

First-time order (workflow)

```
[1] Login   -> [9] Create project -> [11] Pick project -> [15] Deploy (publish online)
(Google)      (firebase init)      (project to use)      (make it public)
```

1. **Login (menu 1):** a browser opens → **sign in with your Google account** → close it on success. (Once only; it's remembered.)
2. **Create project (menu 9):** when English questions appear, use **arrow keys (↑ ↓) + spacebar** to pick, then **Enter**.
3. **Pick project (menu 11):** enter the ID you saw in your project list (menu 10).
4. **Deploy (menu 15):** publishes your app **to the internet**. For safety you must type **YES (uppercase)** to proceed.

"Deploy" goes public, so the kit always asks once more. Closing the window does nothing harmful.

7. How It Works

```
시작하기.bat --> libWstart.ps1 (Korean guide: status detection + menu)
|
├─ [1] --> INSTALL.bat      (install firebase-tools)
├─ [2] --> RUN.bat          (login/projects/deploy, 25 menus)
├─ [3] --> UNINSTALL.bat    (safe removal)
├─ [4] --> 사용설명서.md    (open beginner guide)
└─ [5] --> open Firebase website
```

- `시작하기.bat` is the **single door** that opens the Korean guide (`libWstart.ps1`). The other `.bat` files are **run automatically** by the guide, so you don't click them directly.
- The guide **auto-detects** your PC state (Node, Firebase, login) and **points to your next step**.
- Real work runs in the black (English) window, but the guide explains it in Korean first.

8. 📁 File & Document Locations

Files inside the kit

File	Role
시작하기.bat	Korean guide. Start here.
INSTALL.bat	Install firebase-tools (run automatically)
RUN.bat	25-menu: login, projects, deploy (run automatically)
UNINSTALL.bat	Safe removal (run automatically; keeps your code)
libWstart.ps1	The body of the Korean guide
README.md / README.en.md	Documentation (KO/EN) — this file
사용설명서.md / GUIDE.en.md	Beginner guide (KO/EN)
LICENSE / NOTICE	License · copyright notices

Locations the kit creates/uses (reference)

What	Location
firebase-tools install folder	C:\Users\SW<you>\AppData\Roaming\Wnpm (your folder; no admin)
Login data	C:\Users\SW<you>\W.config\configstore\Wfirebase-tools.json
Install log	firebase_install.log in the kit folder
Uninstall log	firebase_uninstall.log in the kit folder

9. Commands (menu number ↔ real command)

You **don't need to memorize commands**. Press a number and the kit runs it for you. The table below is just so you know what runs underneath.

Menu	What it does	Real command
1	Login	firebase login
2	Logout	firebase logout

Menu	What it does	Real command
3	Who is logged in	<code>firebase login:list</code>
4	Re-login	<code>firebase login --reauth</code>
5	Update the tool	<code>npm install -g firebase-tools</code>
6	Show version	<code>firebase --version</code>
7	Node/npm versions	<code>node -v</code> / <code>npm -v</code>
8	Check for new version	<code>npm view firebase-tools version</code>
9	Create a project	<code>firebase init</code>
10	List my projects	<code>firebase projects:list</code>
11	Pick a project	<code>firebase use <ID></code>
12	Current project	<code>firebase use</code>
13	Run app on my PC	<code>firebase serve</code>
14	Test emulators	<code>firebase emulators:start</code>
15	Deploy everything	<code>firebase deploy</code>
16	Deploy hosting only	<code>firebase deploy --only hosting</code>
17	Deploy functions only	<code>firebase deploy --only functions</code>
18	List hosting sites	<code>firebase hosting:sites:list</code>
19	Functions logs	<code>firebase functions:log</code>
20	All commands help	<code>firebase --help</code>
24	Where is firebase	<code>where firebase</code>
25	Run your own command	<code>firebase <your input></code>

Advanced users can use **menu 25** to type whatever goes after `firebase` and run any command (e.g., `apps:list`).

10. Troubleshooting

Screen / situation	What to do
File won't open / "Windows protected your PC" / blocked	Windows locked the downloaded file. Right-click → Properties → check 'Unblock' → OK (see section 4)
firebase ... not found (installed but not found)	Close all windows and run 시작하기.bat in a fresh window (Windows needs a new window to see the new program)
Can not reach the internet	Check Wi-Fi/internet and retry. On work/school networks, ask IT
Install did not work	Open firebase_install.log in the folder and read the last line (antivirus / corporate network blocking is common)
Scary English black window	It's normal. Don't close it; follow the Korean guide's explanation
Typed a wrong menu number	It just returns to the menu. No worries

11. 🛡️ Safety & Permissions

- **No administrator rights are needed for install or uninstall.** firebase-tools is installed/removed only in **your user folder** (AppData\Roaming\Wnpm), so no Yes/No admin popup appears.
 - Exception: only when **Node.js is missing and auto-installed** may a Windows permission window appear once (to install the engine) → **[Yes]**, it's safe.
- **Deploy** publishes your app **to the internet**, so the kit always requires you to type YES once more.
- **Uninstall** keeps **your code files, Node.js, and your data on Google's servers** intact. It only removes firebase-tools and its settings/cache.

12. ❓ FAQ

Q. Do I need to memorize commands? A. No. Just press numbers. (Advanced users can type their own in Use menu 25.)

Q. Does it cost money? A. This kit is **free** and unrelated to fees. However, **Firebase itself** may incur Google charges (Blaze plan) with heavy usage — check the Google console.

Q. What if I press something wrong? A. Risky actions (deploy, remove) always **ask once more**. You can just close the window.

Q. Do I always need the internet? A. For install, login, and deploy, yes. Some things (like checking an installed version) work offline.

13. 📄 License · Copyright · Commercial Use

This section is written to a **strict standard**. Please review before use.

This kit

- **License: Apache License 2.0** — see [LICENSE](#) in this folder for the full text.
- **Copyright: © 2026 SoDam AI Studio.**
- Apache-2.0 **permits commercial use, modification, and redistribution**. It is provided **AS-IS, without warranty**; you are responsible for your use (LICENSE sections 7–8).

External program this kit helps you install/use

- **firebase-tools** (Firebase CLI) — **License: MIT License, Copyright: © Google LLC**. Source: <https://github.com/firebase/firebase-tools> (this kit only **installs it from the public npm registry**; it does not include or redistribute the code.)

Note on commercial use

- **This kit:** commercial use is allowed under Apache-2.0.
- **Firebase service itself:** Google’s **terms and pricing** apply separately based on usage. For commercial use, review [Firebase pricing](#) and [Google’s terms](#) directly. **This kit takes no**

responsibility for that.

14. Development · Operations · Security Notes

- **Environment variables:** **None** to set. The kit only uses Windows defaults (`%APPDATA%` , `%USERPROFILE%`). (No API key needed up front — login is done via the browser.)
 - **Build: No build step.** Everything runs directly as `.bat` / `.ps1` scripts.
 - **Test / verify:** Run `시작하기.bat` ; if the **[Your PC status]** panel correctly shows Node/Firebase/login state, it works. After install, verify with `firebase --version` .
 - **Security:** No admin rights required, no external server, no secrets/keys included (local only). The install log (`firebase_install.log`) is not committed (handled by `.gitignore`).
 - **Operations:** Update the tool via Use menu **5**. On problems, check the last line of `firebase_install.log` .
-

This kit is an unofficial helper for installing/using Google's firebase-tools (MIT). Not affiliated with Google or Firebase.
